```
The invention relates to a novel isolated nucleic acid molecule comprising: a sequence encoding a sequence comprising 11-1518 amino acids is a sequence comprising 190-8144 bp; or a sequence that selectively hybridises to, or having at least 60% identity with the 11-1518 amino acid or 190-8144 nt sequence. The polypeptide and the nucleic acid are useful for treating breast cancer, and diagnosing or monitoring the presence of metastases of breast cancer in a patient. The polynucleotides of the invention can be used to treat disorders by gene therapy. This sequence represents a breast specific related polypeptide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated nucleic acid molecule, useful for treating breast cancer, and diagnosing or monitoring the presence of metastases of breast cancer in a patient.
                                                                                                                                                                                                                                                                                                                                                                  Cytostatic; BSP-agonist; BSP-antagonist; vaccine; gene therapy; cancer; metastatic; breast cancer; breast specific; human.

The present invention describes human nucleic acid-associated proteins designated NAAP-1 to NAAP-57. The human NAAPS have cytostatic, antiarteriosclerotic, anti-HIV, antiallergic, cerebroprotective, antiarteriosclerotic, anticonvulsant, noctropic, neuroprotective, cantinflammatory, ophthalmological, thyromimetic, antiarthritic, antinflammatory, ophthalmological, thyromimetic, antiparasitic and fungicide activities, and can be used in gene therapy. The NAAP protein and polynucleotide sequences can be used in diagnosing, treating and preventing diseases or conditions associated with the decreased conversariession or overexpression of NAAP, such as cell proliferative diseases (e.g. cancer, atherosclerosis, hepatitis), neurological disorders (Parkinson's disease, Alzheimer's disease, stroke, epilepsy), developmental disorders (renal tubular acidosis, anaemia, glaucoma, hypothyroidism), autoimmunelyinflammatory disorders (atopic dermatitis, arthritis) and infections (e.g. bacterial, viral, catopic dermatitis, arthritis) and infections (e.g. bacterial, viral, viral, from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ð
                                                                                                                                                                                                                                                                                                                                                                                                             The invention describes a new isolated polynucleotide (I) encoding a CC polypeptide with biological activity comprising: a nucleotide sequence of SEQ ID NOS: 1-567 (fully defined); a nucleotide sequence that hybridizes cto the sequence having greater than 99% sequence identity with the sequence of (i) under stringent hybridization conditions; or a nucleotide sequence having greater than 99% sequence identity with the sequence of (i). Also described are: a(n) (expression) vector comprising (I); a host cell genetically engineered to comprise (I) operatively, associated with a regulatory sequence that modulates expression of the polynucleotide in the host cell; an isolated polypeptide comprising a sequence of SEQ ID NOS: 568-1134 (fully defined), where the polypeptide (I); or a polypeptide comprising a composition comprising the polypeptide of (3) and a carrier; an antibody directed against the polypeptide of (3); a method (or detecting the polypeptide of (3); and a carrier; an antibody directed against the polypeptide of (3); and a carrier; an antibody directed against the polypeptide of (3); and a collection of polynucleotides, where the collection comprising of at collection of polynucleotides, where the collection comprising of at collection of polynucleotides, where the collection comprising of at collection of polynucleotides, where the collection comprising of at collection of polynucleotides, where the collection comprising of activity, which comprises any of the amino acid sequence of SEQ ID NOS: 1-567. (I) is a polynucleotide comprising of materiors are fully defined in the specification. The sequences of SEQ ID NOS: 1-567. (I) is a polynucleotide comprising of materiors are septimed of products dependent on DNA and amino acid sequences. The composition and method are useful in diagnostics, forensic, and gene composition and method are useful for treating a disease, burns, CNS and peripheral disease, virtal infection, or cancer. This is the amino acid sequence of a novel polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               66 AGIASSAVEPVCGDAAPACLLRTPLRGLKPTGPRSTWECPPALIVHPPAGGMASGSSQP 125

The invention describes an isolated human nucleic acid (I) encoding any of 120 10-1533 residue amino acid sequences (S1), given in the specification, comprising any of 164 179-12421 base pair sequences (S2), given in the specification. The methods and compositions of the present invention are useful for identifying, diagnosing, monitoring, staging, imaging and treating lung cancer and non-cancerous diseases of the lung. They are also used for identifying lung tissue, monitoring and identifying and/or designing antagonists of the polypeptide of the invention, gene therapy, production of transgenic animals and production of engineered lung tissue for treatment and research. This is the amino acid sequence of a lung specific nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated human nucleic acid molecule and polypeptide, useful for identifying, diagnosing, monitoring, staging, imaging and treating lung cancer and non-cancerous diseases of the lung.
                                                                                                                                                                                                                        Human; gene therapy; vaccine; lung specific antigen; cancer diagnosis; cancer monitoring; cancer staging; cancer imaging; lung cancer; non-cancerous diseases of the lung; transgenic animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            61 AGIASSAVEAVCGDAAPACLLRTPLRGLLKPTGPRSTMECPPALIVHPPTGGMARRAASQ

                                                                                                                                                                                                                                                                                                                                                                                                                        The invention describes an isolated human nucleic acid (I) encoding any of 120 10-1533 residue amino acid sequences (S1), given in the specification, comprising any of 140-12421 base pair sequences (S2), given in the specification. The methods and compositions of the present invention are useful for identifying, diagnosing, monitoring, staging, invention are useful for identifying, diagnosing, monitoring of the lung. They are also used for identifying lung tissus, monitoring and identifying and/or designing antagonists of the polypeptide of the innormation, gene therapy, production of transgenic animals and production of engineered lung tissus for treatment and research. This is the amino acid sequence of a lung specific nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1 SPHOAAAPVDQTPRILATMGQRALPSSLALLSRPLSPPPAACSGDPGCGSGAGLPSASAA 60
                                                                                                                                                                                                                                                                                                                                                 New isolated human nucleic acid molecule and polypeptide, useful for identifying, diagnosing, monitoring, staging, imaging and treating lung cancer and non-cancerous diseases of the lung.

                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to 2495 novel polynucleotides (I) and their encoded polypeptides, sequences hybridizing to these nucleotides, sequences encoding partial polypeptides and sequences having 70% to 90% identity to the nucleotide and protein sequences. The nucleotides and polypeptides are useful as diagnostic markers or therapeutic target for the diseases or morbid states. They are also useful for treating osteoporosis, neurological diseases, Alzheimer's diseases, Parkinson's diseases, dementia and various cancers. This sequence corresponds to a protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   97 PAPASAPLTIPISAPLTVSASG----PALLTSVTPPLAPVVPAAPGPPSLAPSGASPSAS 152

The present invention describes primer sets for synthesising 5602 full-
length cDNAs defined in the specification. Where a primer set comprises:

(a) an oligo-dr primer and an oligonuclectide complementary to the complementary strand of a polynuclectide which comprises one of the 5602 nucleotide sequences defined in the specification, where the comprises at least 15 nucleotides; or (b) a combination of a noligonucleotide comprising a sequence complementary to the compression of an oligonucleotide comprising a sequence complementary to a sequence and an oligonucleotide comprising a sequence complementary to a complementary strand of a polynucleotide which comprises a 3'-end sequence, where the comprises at least 15 nucleotides and the combination of the 5'-end sequence/3'-end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and in comprise therapy. The primer sets can be used in antisense therapy and in compression of the full-length cDNAs. The primers are also useful for the primer sets can be the full sequence of the full-length cDNAs. The primers are also useful for the full-length cDNAs. The primers also useful for the full-length cDNAs. The prime

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention relates to novel mitochondrial targets that can be used for therapeutic intervention in treating a disease associated with altered mitochondrial function. Specifically, it refers to a method for identifying proteins of the human heart mitochondrial proteome that are useful for drug screening assays, as well as therapeutic targets. The present invention describes a method for identifying such proteins that can be used in the treatment of various diseases associated with altered mitochondrial function including diabetes mellitus, Huntington's disease, osteoarthritis, Leber's hereditary optic neuropathy (LHON), mitochondrial concephalopathy lactic acidosis and stroke (MELAS), myoclonic epilepsy ragged red fibre syndrome (MERAP) or cancer. Accordingly, these compositions have neuroprotective, nootropic, antidiabetic, anticonvulsant, antiarthritic, osteopathic, ophthalmological and cytostatic activities This polypeptide sequence is a human heart

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention relates to novel, isolated full length human cDNA molecules and the encoded proteins thereof. Specifically, it refers to cDNA clones obtained by an oligo-capping method, where none of these clones are identical to any known human mRNAs. The present invention describes an immunoassay to identify agonists and antagonists, as well as thibodies, antisense molecules and siRNAs that can all be used to bind to and modulate expression of the CDNA molecules. As such, these molecules are useful for diagnostic markers or therapeutic targets for the various diseases or morbid states. In particular, they are useful in gene therapy for treating osteoporosis, neurological disease, Alzhaimer's disease, Parkinson's disease, dementia, short memory and various cancers,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New 1995 cDNA, useful for treating osteoporosis, neurological diseases, Alzheimer's diseases, Parkinson's diseases, dementia and various cancers.

The invention relates to novel human diagnostic and therapeutic

polymucleotides designated dithp (ACC46080-ACC46749) and to their encoded

proteins (DITHP, ABRAH181-ABRAH1812). The invention also relates to

proteins (DITHP, ABRAH1812). The invention also relates to

polymucleotide sequences at least 90% identical to the dithp cDNA

comprised to recomplishing a dithp nucleic acid sequence; the

recombinant production of DITHP proteins; antibodies specific for DITHP

correcting dithp nucleotide and protein sequences; methods of sereening

correcting dithp nucleotide and protein sequences; methods of sereening

correcting dithp nucleotide and protein sequences; methods of sereening

correcting dithp nucleic acid sequences and DITHP proteins may be used in the

probe. Dithp nucleic acid sequences and DITHP proteins may be used in the

correcting dithp nucleic acid sequences and DITHP proteins and other cell

correcting and variety of conditions including cancer and other cell

correcting and or parasitic infections; inflammatory disorders; bacterial,

correcting can additionally be used in analysis of the proteome of a tissue

correction and to induce antibodies. The dithp nucleic acids are

correctly useful in somatic or germline gene therapy of the disorders

correctly useful in somatic or germline gene therapy of the disorders

Sequence 2971 AA;

င္တ

```
AAC74446 to AAC77606 encode the proteins given in AAB40237 to AAB43397,
which represent the human ORFX open reading frames 1 to 3161. The ORFX
sequences have activities such as: cytostatic; hepatotropic; vulnerary;
antiporiatic; antiparkinsonian; nootropic; neuroprotective; osteopathic;
anticonvulsant; antibarkinic; immunosuppressant; immunostimulant;
cardiant; thrombolytic; coagulant; vasotropic; antidiabetic; hypotensive;
dematological; immunosuppressive; antidiabetic; hypotensive;
cardiant; thrombolytic; coagulant; vasotropic; antidiabetic; hypotensive;
copuences can be used for determining the presence of or predisposition.
CRX-associated disorder. The nucleic acids can be used to express ORFX
proteins in gene therapy vectors. The proteins and nucleic acids may be
used to treat cancers, proliferative disorders, neurodegenerative
disorders, osteoarthritis, graft vs host disease, cardiovascular disease,
diabetes mellitus, hypertension, hypothyroidism, cholesterol ester
storage, systemic lupus erythematosus, severe combined immunodeficiency
clockers, asthma, allergies, aplastic anaemia, burns, wounds, bone and
cartilage damage, nocturnal haemoglobinuria, antiinflammatory disease; to
chance coagulation; to inhibit thrombosis; and as a contraceptive
                                                                                                                                                                                 Human; open reading frame; ORFX; detection; cytostatic; hepatotropic; vulnerary; antipsoriatic; antiparkinsonian; nootropic; neuroprotective; anticonvulsant; osteopathic; antiarthritic; immunosuppressant; cardiant; immunostimulant; thrombolytic; coagulant; vaeotropic; antidiabetic; hypotensive; dermatological; immunosuppressive; antinflammatory; hypotensive; dermatological; immunosuppressive; antinflammatory; antianaemic; gene therapy; cancer; proliferative disorder; hypertension; neurodegenerative disorder; osteoarthritis; graft vs host disease; cardiovascular disease; diabetes mellitus; hypothyroidism; SCID; AIDS; cholesterol ester storage; systemic lupus erythematosus; infection; severe combined immunodeficiency; malaria; autoimmune disorder; asthma; allergy; aplastic anaemia; nocturnal haemoglobinuria; burn; wound; bone damage; cartilage damage; antiinflammatory disease; coagulation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel nucleic acids and peptides derived from open reading frame X,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         useful for treating e.g. cancers, proliferative disorde
neurodegenerative disorders and cardiovascular disease.
                                                                                                                                          Human ORFX ORF995 polypeptide sequence SEQ ID NO:1990.

                                                                                 The invention describes a method of diagnosing breast cancer in subject comprising contacting biological sample from subject with at least two different breast cancer-associated polypeptides (I) encoded by nucleic acid molecules (II) comprising sequence chosen from 42 fully defined sequences as given in specification, determining specific binding between (I) and agents in sample, where presence of the binding is diagnostic for breast cancer. The method is useful for diagnosing breast cancer in a subject. The sample is blood, lymph node fluid or breast discharge fluid. This is the amino acid sequence of a breast cancer antigen.

It has ATPase activity and is capable of activating transcription. SRCAP polypeptides are useful for activating transcription in a cell, for enhancing CREB (cAMP regulatory element) binding protein (CBP)-mediated activation of transcription in a cell, for transcription in a cell, for transcription in a cell, for transcription of a disease involving a function such as insufficient transcription of a gene, e.g. a gene mediated by CBP co-activation, DEAD box RNA dependent

helicase, adenoviral DBP protein, beta-actin or a nuclear receptor affected by SRCAP protein. Compounds that modulate SRCAP function, such as antibodies, antisense molecules, polynuclectides or ribozymes, are useful treating diseases medicaled by SRCAP-activated transcription, for example, infection by adenovirus, hepatitis C virus, human immunodeficiency virus type-1, Epstein Barr virus, cytomegalovirus or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; SRCAP; Snf2 related CBP activator protein; antiviral; CREB; cAMP regulatory element; CREB binding protein; CBP; Afrase; transcription activation; DRAD box RNA dependent helicase; adenoviral DBP protein; beta-actin; nuclear receptor; viral infection.

                                                                                                                                                                                                  hepatitis B virus
                                                                                                                                                                                                                                                                 Sequence 2972 AA;
```

The present sequence is an Shf2 related CREB (CAMP regulatory element)
binding protein (CBP) activator protein (SRCAP) polypeptide. It has
Alpase activity and is capable of activating transcription. SRCAP
polypeptides are useful for activating transcription in a cell, for
enhancing CREB (CAMP regulatory element) binding protein (CBP) mediated
activation of transcription in a cell, for treating a patient having a
clisease involving a function such as insufficient transcription of a
gene, e.g. a gene mediated by CBP co-activation, DEAD box RNA dependent
helicase, adenoviral DBP protein. beta-actin or a nuclear receptor
affected by SRCAP protein. Compounds that modulate SRCAP function, such
as antibodies, antisense molecules, polymucleotides or ribozymes, are
useful for treating diseases mediated by SRCAP-activated transcription,
immunodeficiency virus type-1, Epstein Barr virus, tytomegalovirus or
chepatitis B virus ¥88888888888888888888888

Calcium-binding protein calphotin - fruit fly (Drosophila melanogaster)
Calcium-binding protein calphotin - fruit fly (Drosophila melanogaster)
C;Species Drosophila melanogaster
C;Date: 21-Sep-1993 #sequence_revision 18-Nov-1994 #text_change 09-Jul-2004
C;Accession: A47282
R;Martin, J.H.; Benzer, S.; Mudnick, M.; Miller, C.A.
Proc. Natl. Acad. Sci. U.S.A. 90, 1531-1535, 1993
A;Title: Calphotin: a Drosophila photoreceptor cell calcium-binding protein.
A;Reference number: A47282
A;Atcession: A47282
A;Atcession: A47282
A;Status: preliminary
A;Molecule type: nucleic acid
A;Residues: 1-865 cMAR>
A;Cross-references: UNIPROT: Q02910; UNIPARC: UPIO0001282D3; GB:L02111; NID:g157031; PIDN: A;Experimental source: photoreceptor cells

The genome sequence of Ustilago maydis.";
Submitted (FEB-2004) to the EMBL/Genbank/DDBJ databases.
C -1- CAUTION: The sequence shown here is derived from an
EMBL/Genbank/DDBJ whole genome shotgun (WGS) entry which is
Preliminary data.

EMBL, AACPO1000043; EAK81826.1; -; Genomic_DNA.

Sequence 4, Application US/10024450 Patent No. 6927030

US-10-024-450-4

```
GENERAL INFORMATION:
APPLICANT: Marc J. Rubenfield et al.
APPLICANT: Marc J. Rubenfield et al.
TITLE OF INVENTION: NUCLEICA ACID AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS. AND THERAPEUTICS
FILE REFERENCE: 107196.136
CURRENT APPLICATION NUMBER: US 60/074,788
PRIOR APPLICATION NUMBER: US 60/074,788
PRIOR PILING DATE: 1998-02-18
PRIOR PILING DATE: 1998-07-27
NUMBER OF SEQ ID NOS: 33142
SEQ ID NO 28087
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                942 TPDVC-PSSPA--LQTPSLSSGQLPPLLIPTDPSSPPPCPPVLTVATPPPPLLPTVPLPA 998
